Test of 3"/70 AA Projectiles
for Effectiveness of Base Cover Plates

PART A

SYNOPSIS

1. Forty-five (45) 3"/70 AA projectiles Type EX 24 Mod 9 were fired for recovery in gun Type G Mod 14, Serial No. 24934. The projectiles were modified by drilling holes of various sizes in the bases, covered with standard and thicker-than-standard base cover plates and fired at service and proof pressure, to determine the effectiveness and limitations of base cover plates.
2. On the 3"/70 projectile a standard base cover plate ($\frac{1}{16}$ " thick) will afford adequate protection against powder gasses at proof or service pressure for any hole in the projectile base up to and including $3/32"$ in diameter. An 18 gage base cover plate ($\frac{1}{32}$ " thick) will afford protection when fired at service pressure for any hole up to and including $3/16"$ in diameter and at proof pressure for any hole up to and including $1/8"$ in diameter.

PART B

INTRODUCTION

1. AUTHORITY:

This program was authorized by reference (a).

2. REFERENCES:

- a. BUORD ltr Re3b-PAB:mt Ser 14225 of 23 Jan 1952
to NAVPROV
- b. BUORD SK. No. 328486 3"/70 AA Projectile Type EX 24 Mod 9

3. OBJECT OF TEST:

The object of this test was to determine the effectiveness and limitations of base cover plates on 3"/70 AA projectiles.

4. PERIOD OF TEST:

- | | |
|------------------------|-----------------|
| a. Date of Directive | 23 January 1952 |
| b. Date Test Commenced | 25 January 1952 |
| c. Date Test Completed | 16 May 1952 |

PART C

DETAILS OF TEST

5. DESCRIPTION OF ITEMS UNDER TEST:

- a. Projectile: 3"/70 AA projectiles EX 24 Mod 9 in accordance with reference (b) were modified by the Lansdowne Steel and Iron Co. Fifty (50) EX 24-9 projectiles were divided into ten (10) groups of five (5) each. Modifications, as shown in Figure 10, are as follows:

Test of 3"/70 AA Projectiles
for Effectiveness of Base Cover Plates

<u>Variation</u>	<u>Drill Size</u>	<u>Cover Plate Thickness</u>
"A"	1/4"	Standard (#031)
"B"	3/16"	"
"C"	1/8"	"
"D"	3/32"	"
"E"	1/16"	"
"AF"	1/4"	18 gage (#0478)
"BG"	3/16"	"
"CH"	1/8"	"
"DJ"	3/32"	"
"EK"	1/16"	"

Projectiles marked "E" and "EK" had a 1/32" slitting saw cut located off center on the base of the projectile in addition to the holes (Figure 10).

Projectiles of variation "B" were not fired based on the firing results of variation "C".

b. Gun: The 3"/70 gun Type G Mod 14 No. 24934 has a short run-up, 1 in 20 caliber twist, and disappearing rifling. At the start of this test the subject gun had 23.38 ESR.

6. PROCEDURE:

All projectiles were prepared for recovery firing in the gun Type G Mod 14 by stripping the forward bands, epsom salt loading to a total weight of 15 pounds, and fitting with flat dummy nose plugs (Figure 11). Two projectiles of each variation tested were fired at proof pressure and three of each variation at service pressure. After recovery, the positions on the base plates corresponding to the holes in the projectile bases were examined and a typical example was photographed either with the base plate in position or machined off (Figures 2-9). When deformation was present, the base plates were removed and gaged (Tables II, III, IV and V, Appendix (A)). Hardness readings were taken on two plates of each type after firing. The average hardness (Rc T-15 scale) for the standard plates was 78.9 and for the 18 gage plates 79.9.

All rounds were crimped in EX 5 cases.

Test of 3"/70 AA Projectiles
for Effectiveness of Base Cover Plates

7. RESULTS AND DISCUSSION:

Complete before and after firing data are given for each round in Tables I-V, inclusive, Appendix (A); a summary of the firing data is included as Table VI, Appendix (B); a photograph of an unfired EX 24-9 projectile is shown as Figure 1; and photographs of the cover plates are included as Figures 2-9, inclusive. If one base plate in any variation had a through hole upon recovery, that variation was considered to have failed. The condition of each plate after recovery is given in Tables I through V, and a summary of the condition for each variation is given in Table VI.

All standard thickness (.031) base cover plates fired at service or proof pressure passed with holes in the projectile base of 3/32" in diameter. Plates of the 18 gage (.0478) thickness fired at service pressure passed with holes of 3/16" in diameter and at proof pressure with holes of 1/8" in diameter. In each case the next larger hole size caused a failure of the base plate.

The slot modification in the projectile bases combined with 1/16" diameter holes (variations "E" and "EK") had no additional effect on the base plate. Upon recovery, some plates of these variations had the metal of the plates raised in positions corresponding to the 1/16" holes and the ends of the slots. The raised portions of the base plates can be attributed to small quantities of metal having been left around the rims of the holes on the projectile bases, evidently due to these positions having been punch-marked.

PART D

CONCLUSIONS

8. It is concluded that:

- a. On the 3"/70 projectile a standard base cover plate (.031 thick) will afford adequate protection against powder gasses at proof or service pressure, for any hole in the projectile base up to and including 3/32" in diameter. An 18 gage base cover plate (.0478 thick) will afford protection when fired at service pressure for any hole up to and including 3/16" in diameter and at proof pressure for any hole up to and including 1/8" in diameter.
